@SouthwestAir three cheers to your Denver staff. Don't know if we will get out but they're keeping us smiling.

Calling `st.pyplot()` without providing a figure argument has been deprecated and will be removed in a later version as it requires the use of Matplotlib's global figure object, which is not thread-safe.

```
fig, ax = plt.subplots()
ax.scatter([1, 2, 3], [1, 2, 3])
# other plotting actions...
st.pyplot(fig)
```

[illegible]
